

I have heard much discussion about BPL technology and how it would interfere with radio communication devices. While many of these studies have been conducted that in fact show high levels of interference caused by BPL, I have yet to find any discussion or conducted studies as it relates to how this technology would in fact NOT interfere with these same radio communication devices.

It would appear that the only technical information available are studies that relate to the harmful effects this technology would have on the radio spectrum.

In the absence of any conclusive studies that suggest no harm will be done to the radio spectrum, I would have no choice but to conclude that based on the available information provided, BPL technology would not serve the common good in the long term.
